Morbidity and Mortality

Weekly Report

PUBLIC HEALTH SERVICE

U.S. DEPARTMENT OF HEALTH, EDUCATION, AND WELFARE

Prepared by the

COMMUNICABLE DISEASE CENTER

MElrose 4-5131

For release August 25, 1961

Atlanta 22, Georgia

Vol. 10, No. 33

Provisional Information on Selected Notifiable Diseases in the United States and on Deaths in Selected Cities for Week Ended August 19, 1961

Type I Oral Polio Vaccine — On August 17, 1961, the Surgeon General of the Public Health Service, Dr. Luther L. Terry, announced the grant of a license to Pfizer Ltd. for the manufacture of live oral polio vaccine, Type I. The Public Health Service has purchased 900,000 doses of this vaccine to be held in reserve at the Communicable Disease Center for use in the event of an epidemic or epidemic threat of Type I polio anywhere in the U. S. A local community will be able to request the vaccine through their State Health Department if at least 3 cases of polio have occurred in the community within a month and if at least two have been confirmed to be Type I by laboratory analysis.

Poliomyelitis - There was a 28 percent increase in the total number of cases reported this week, and a 33 percent increase in paralytic cases, compared to figures for the previous week. The total for the current week was 69 cases of which 48 were paralytic. For the previous week, the total was 54, including 36 paralytic cases.

The figures for the current week are the highest reported this year but are less than half those reported for the comparable week in 1960. The cumulative totals for the first 33 weeks and for comparable weeks during each of the past four years are shown below.

(Continued on page 2)

CURRENT U.S. POLIO INCIDENCE COMPARED WITH YEARS 1955-1960; APRIL-AUGUST, BY WEEK

PROVISIONAL DATA SUPPLIED BY NATIONAL OFFICE OF VITAL STATISTICS
AND COMMUNICABLE DISEASE CENTER

Poliomyelitis Cases (Cumulative) through 33rd Week for 1957-1961

10: 1/)/ 1/01												
	1961	1960	1959	1958	1957							
Paralytic	323	874	2,201	835	1,057							
Total	490	1,224	3,401	1,691	3,242							

Both Florida and New York reported nine cases this week. Eight of the Florida cases are from the small county of Gadsden in northwest Florida where seven paralytic cases and one nonparalytic case have occurred between July 6 and August 2. The seven paralytic cases were all unvaccinated Negro children. There have been no cases since August 2. Type I poliovirus has been isolated from one case. An intensive immunization program using formalin-inactivated vaccine is under way.

Of the nine cases in New York, the five paralytic cases were from the Madison-Oneida County area. Last week's summary included a report of these five cases. Not yet reflected in the telegraphic reports are eight additional paralytic cases from this area. This brings the total to 14 paralytic cases with onsets between August 1 and August 19. Specimens for isolation and typing are

under study in the State laboratory. Additional information on the recent cases will be presented next week.

The six paralytic cases in Maryland include four more from the Type III outbreak in Frederick County. This brings the year's total in this outbreak to 13 paralytic cases. Nine of these cases are in the 5-14 year old age group with the remaining four under five. Eight of 12 cases with vaccination status known are unvaccinated and three have had three or more doses of formalin-inactivated vaccine. An intensive immunization program is continuing.

Hepatitis - The current weekly total of 1,044 cases of hepatitis is approximately the same as has been reported for the past six weeks.

EPIDEMIOLOGICAL REPORTS

Enterapathogenic E. coli Epidemic - Illinois and Indiana

During the fall and winter of 1960 and 1961, a progressive increase in the incidence and severity of diarrhea among infants was noted in the metropolitan Chicagonorthwestern Indiana area. The illnesses were generally severe, often accompanied or preceded by nonspecific respiratory symptoms and notable by the severity of vomiting, diarrhea, dehydration and electrolyte disturbances. Cooperative investigations, continuing to date, were initiated by the Illinois State Department of Health, the Cook County Health Department, the Chicago Board of Health, the Indiana State Board of Health, local health departments of Lake County, and the Communicable Disease Center.

Over a ten-month period beginning in August 1960, 1,373 cases of gastroenteritis were hospitalized in 25 hospitals in south central Chicago and Cook County and in four hospitals in Lake County, Indiana. In the epidemic areas, over 4% of children in the highly susceptible 0 to 6 month age group experienced at least one hospitalization for gastroenteritis. A total of 76 deaths due to gastroenteritis occurred during the outbreak.

The number of hospitalized cases rose steadily throughout the fall and reached a peak in late December and January. The number of admissions remained at a high level until early March when a progressive decline occurred.

The majority of cases (86%) were between 0 and 18 months of age; only 8% were in the susceptible neonatal period. Most cases were among white children, the percentage reflecting racial distribution in the area. Over 40% had had some hospital contact within the preceding 30 days.

Of patients cultured, E. coli O 111:B4 was obtained from 40% of the group. The organisms were resistant, by (Continued on page 8.)

The chart shows the number of deaths reported for 117 major cities of the United States by week for the current year, a 5-week moving average of these figures plotted at the central week, and an adjusted average for comparison. For each region the adjusted average was computed as follows: From the total deaths reported each week for the years 1956-1960, 3 central figures were selected by eliminating the highest and lowest figure reported for that week. A 5-week moving average of the arithmetic mean of the 3 central figures was then computed with adjustment to allow for population growth in each region. The average value of the regional increases was 2 percent which was incorporated in the adjusted average shown in the chart.

Table 4 shows the number of death certificates re-

ceived during the week indicated for deaths that occurred in selected cities. Figures compiled in this way, by week of receipt, usually approximate closely the number of deaths occurring during the week. However, differences are to be expected because of variations in the interval between death and receipt of the certificate and because of incomplete reporting due to holidays or vacations. If a report is not received from a city in time to be included in the total for the current week, an estimate is used.

The number of deaths in cities of the same size may also differ because of variations in the age, race, and sex composition of the populations and because some cities are hospital centers serving the surrounding areas. Changes from year to year in the number of deaths may be due in part to population increases or decreases.

Table 3. DEATHS IN SELECTED CITIES BY GEOGRAPHIC DIVISIONS

(By place of occurrence and week of filing certificate. Excludes fetal deaths. Data exclude figures shown in parentheses in table 4)

disc sensitivity tests, to all commonly employed anti-

Continued surveillance and study of the problem is being carried out and a number of preventive measures have been instituted.

It is pertinent to note that this is the second major outbreak of *E. coli* O 111:B4 diarrhea recorded this winter. The first outbreak in Louisiana was described in the MMWR Vol. 10, No. 8.

(Reported by Dr. Norman J. Rose, Chief, Bureau of Epidemiology, Illinois Department of Public Health and Dr. John A. Googins, State Epidemiologist, Indiana State Board of Health.)

Rabies in a Flying Squirrel - Florida

On June 16, near St. Petersburg, a small flying squirrel (Glaucomys volans querceti) was found on the ground by several young boys, captured and carried home. In the process, two of the boys were bitten on the fingers. The following day the squirrel was noted to be foaming at the mouth and about noon it died.

Negri bodies were demonstrated in the brain tissue by Mr. H. D. Venters, Director, Florida State Board of Health Regional Laboratory. Confirmation by fluorescein tagged antibody examination and by mouse injection was made by the State Laboratory.

Although extensive trapping was carried out in the open pine woods area where the squirrel was obtained, only two cotton rats and seven flying squirrels were obtained. (Juveniles from an adjacent sub-division exert a heavy hunting pressure). The two cotton rats had been destroyed by insects when retrieved; the seven squirrels showed no evidence of rabies on examination.

The rabies picture in Florida is unique in that approximately one-half of the total raccoon rabies in the U.S. is reported from this State; a relatively large percent of bat rabies in the U.S. has also been reported from Florida. Both these species are tree dwellers. This first case of rabies in a flying squirrel adds another species of tree dwelling animals in which rabies has been found in Florida.

(Reported by J. E. Scatterday, Director, Division of Veterinary Public Health, Florida State Board of Health.)

FOR SOURCE AND NATURE OF MORBIDITY DATA SEE
LAST WEEK'S MORBIDITY AND MORTALITY WEEKLY

REPORT

International Notes

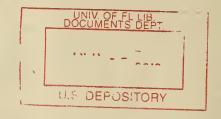

On August 17, Hong Kong was declared a cholera infected port. Official reports from World Health Organization as of August 23 confirmed 20 cases of cholera and 3 deaths. This is the first time in 14 years that cholera has been reported from Hong Kong. On August 18 at the request of Hong Kong authorities, the U. S. Government shipped 250,000 cc. of cholera vaccine to Hong Kong for use in control of the epidemic. The Chinese Nationalist Government on Taiwan has also initiated a cholera immunization program.

Epidemics of cholera and cholera-like disease have been occurring in the last several months in many areas of the Far East (Mainland China, Macao, Sarawak, and Java) which have reportedly been free of cholera for over 14 years.

Cholera immunization for travelers to the Far East is strongly recommended.
